

A Neural-network based Chat Bot

ABSTRACT

Chatbots, or conversational interfaces as they are also known, present a new way for individuals to interact with computer systems. Traditionally, to get a question answered by a software program involved, using a search engine, or filling out a form. A chatbot allows a user to simply ask questions in the same manner that they would address a human. In your free time you can do chatting with this bot. It can play music for you, do basic search, set alarm using voice command.
